ACKNOWLEDGEMENTS

We couldn't have finished this project without the help and technical assistance of many people. In particular, we would like to thank our family. The amount of time and effort that goes into this project is hard to measure.

Especially, we truly had a fantastic person helping us - Mr. Hoang Xuan Son, his professional guidance and his experience help us to overcome the obstacles, even the hardest time when we think we can't continue with this project anymore. He has truly had a significant impact on the success of this project.

We would like to extend a special thank you to our teacher, friends who have support us throughout 4 months of this project.

3. Problem:

Today, the progress of modern science has an impact on all aspects of human life. And in which the growth of traffic, especially the transport has flourished to help people be able to move freely and safely. We already have electric cars that are environmentally friendly, self-driving cars of Tesla help people in traffic safely, comfortably.

Figure 1: Electric car

Figure 2: Self-drive car of Tesla

Currently, people are very interested in the transportation of human friendly. In addition to that the self-propelled mechanism it can also help people in traffic safely while they can still do other work.

Figure 3: Self-drive car

Besides all kinds of modern transport, the bicycle as a means of transport is indispensable in today's life. It just helps to avoid traffic jams in big cities, but also a means to help people improve health modernization.

Figure 4: Bike cycle in the city

4. Existing Solution:

4.1 Smart Balance Wheel:

As personal transportation, suitable to move in large spaces, walking neighborhoods or urban area, can go shopping in large supermarkets, or delivered in the large lobby.

Figure 5 - Smart balance wheel

Disadvantages: for people with disabilities, difficulty in standing, or not to keep the balance, or those who prefer sports activities, then this is not a good choice for them.

4.2 Ninebot – Personal Transportation Robot:

Figure 6 - Ninebot – Personal Transportation Robot

Ninebot is the new smart moving vehicle of Segway- one brand of US. It has the ability to move faster than walking 4 times, easy to move on the road with 15 degrees slope and rocky road, can go a long way 30km.

It helps you move quite convenient but it's quite voluminous and those who prefer to movement, this is not the first choice.

5. Ideas:

With a bicycle self-balanced, self-moving, people with disabilities can participate in traffic with ease, even with healthy people need exercise, the car is still not a bad choice. Moreover, subsequent to the development of self-propelled mechanism, the vehicle can move to the location was chosen before, very suitable for the delivery of automatic cave without shipper, as well as shuttle children to kindergarten or carrying them home safely.

Figure 7 - Self-balance bicycle

Therefore, in order to express the passion of science, as well as creative inspiration, favorite robot programming department in particular and in general Embed FPT University students. And particularly complete learning program at FPT University, we have decided to implement the scheme self-balancing bike to complete the above purposes.

6. Feature Function:

The system has two main parts: self-balancing bike moving and self-balancing bike while moving with the control of the smart phone running Android.

- Bicycles balance when moving itself.
- Bicycles can turn left, turn right with the control of smartphone.

II. System Project Management Plan (SPMP):

1. Purpose:

The purpose of this chapter is to describe the organization and plan of the project. All team members must use this chapter as a guideline for tracking assigned tasks and deadlines. This chapter also included an overview of this project and team member. This is a document for daily meeting and meeting minute.

2. Project Organization:

2.1 System Process Model:

Our project uses the Iterative and Incremental Software Process Model.

Iterative and incremental software development is a method of software development that is modeled around a gradual increase in feature additions and a cyclical release and upgrade pattern.

Iterative and incremental software development begins with planning and continues through iterative development cycles involving continuous user feedback and the incremental addition of features concluding with the deployment of completed software at the end of each cycle.

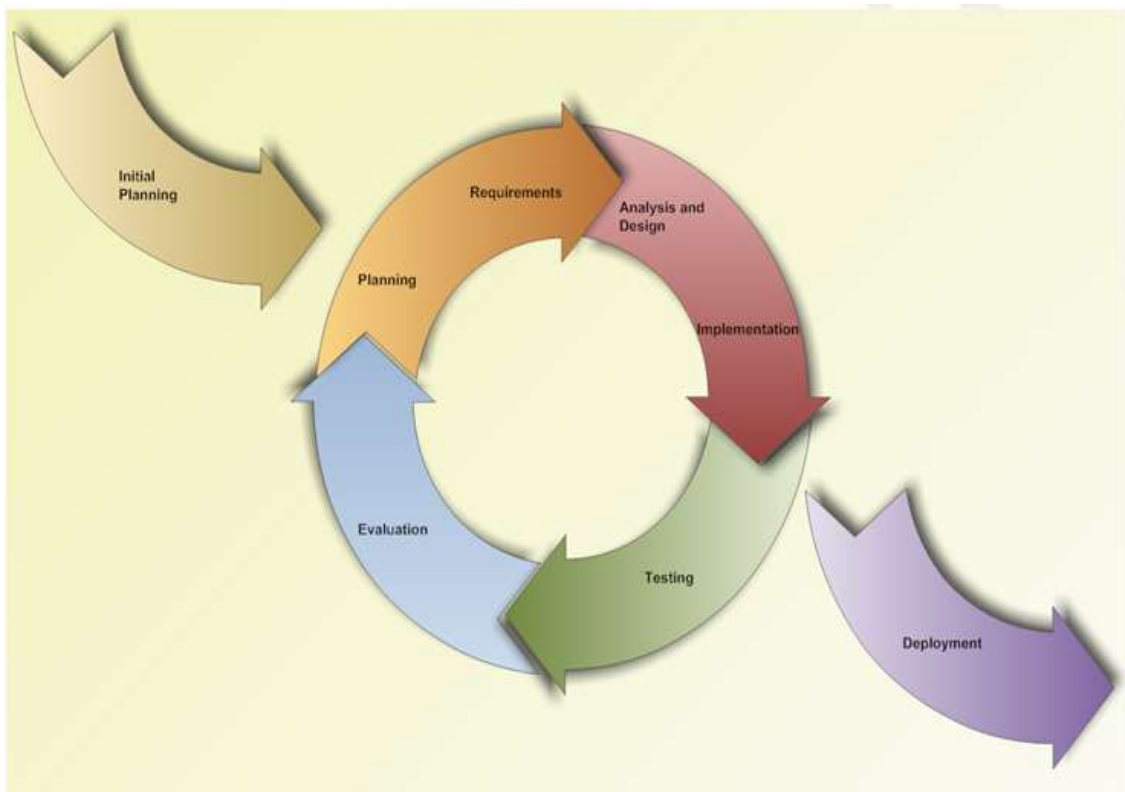

Figure 8 - Iterative and Incremental Software Process Model

2.2 Roles and Responsibilities:

| No | Name | Role | Responsibilities |
|----|--------------------|------------------|---|
| 1 | Hoàng Xuân Sơn | Supervisor | <ul style="list-style-type: none"> - Approving and supporting process to run project. - Suggesting solution when the project meets issue. |
| 2 | Nguyễn Trọng Thịnh | Project Manager | <ul style="list-style-type: none"> - Select methodology to identify risk. - Set common rule to all members in project to avoid risk. - Approve solution to resolve issues. |
| 3 | Vũ Tiến Trung | Technical Leader | <ul style="list-style-type: none"> - Investigate technical issues. - Review source codes. |
| 4 | Trần Văn Tuấn | QA Leader | <ul style="list-style-type: none"> - Keeping all of member on process and follow common rule. - Reviewing quality of resolved issues. |
| 5 | Vũ Quang Quyền | Developer | <ul style="list-style-type: none"> - Follow process of project. - Follow common rule of project. - Raise issue to leader in team meeting. |
| 6 | Lưu Ngọc Việt Sơn | | |

Table 2- Roles and Responsibilities

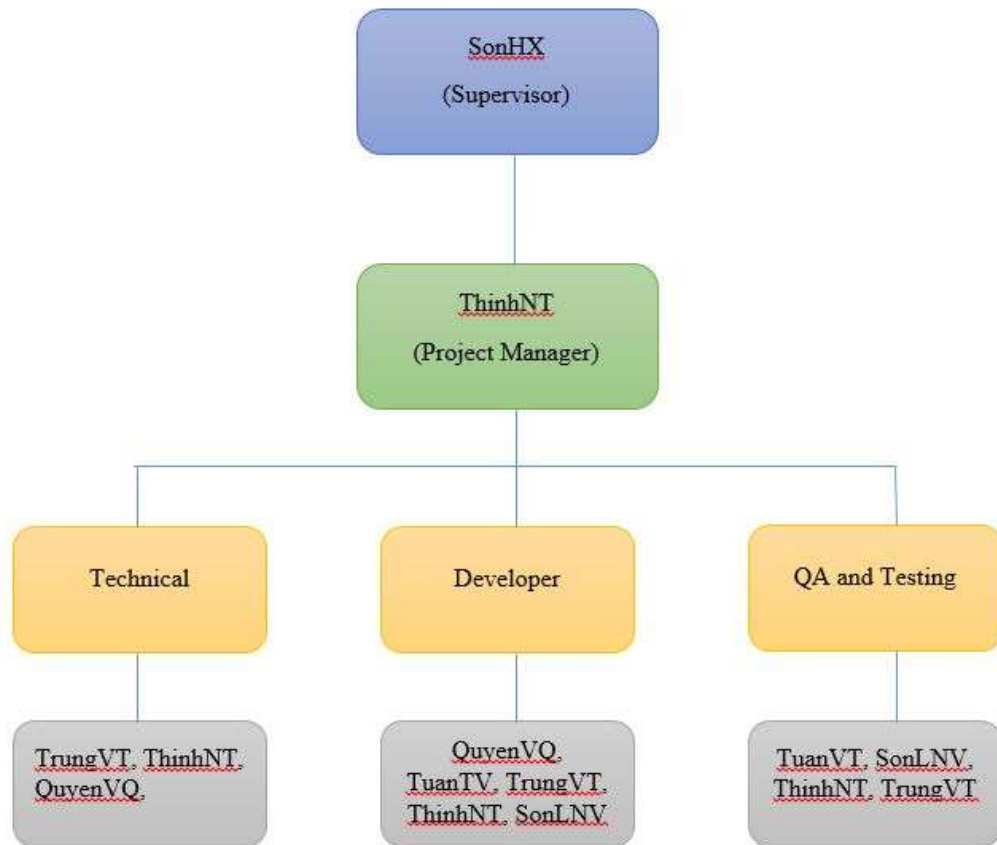

Figure 9 - Project Team Member

2.3 Tool and Techniques:

Hardware

The robot hardware can be classified into the following parts:

- Mechanical Model
- Custom Mainboard
- Inertial sensors : combine gyroscopes and accelerometers
- Actuators: (DC Motor with QEI Encoder)
- Wireless Communication : Bluetooth module
- Addition hardware: - Program/Debug Device

Software

Arduino

- Operating System: Windows 10.
- Hardware Simulation Software: ISIS Proteus 8 Professional.
- Technologies: Arduino, C, C++.
- IDE: Arduino, Sublime Text 3.

Android

- Wireless Communication: Bluetooth module
- Technologies: Java, Android.
- IDE: Android Studio.

3. Project Management Plan:

3.1 Task:

| | Tas Mo | Task Name | Duration | Start | Finish | Pred | Resource Names | Early Start |
|----|--------|---|----------|-------------|-------------|------|-----------------|-------------|
| 1 | ✓ | Initiating | 5 days | Tue 3/22/16 | Mon 3/28/16 | | | Tue 3/22/16 |
| 2 | ✓ | Develop Project Charter | 5 days | Tue 3/22/16 | Mon 3/28/16 | | | Tue 3/22/16 |
| 3 | ✓ | Kick off meeting | 1 day | Tue 3/22/16 | Tue 3/22/16 | | ThinhNT | Tue 3/22/16 |

3.2 Meeting minute:

An example of group's meeting minute during the time executed project:

| | | | |
|-----------------------|--------------|--------------|---------------------------|
| Meeting/Project Name: | Amazing Bike | | |
| Date of Meeting: | 03/22/2016 | Time: (Type) | 2 hours |
| Facilitator: | ThinhNT | Location: | Library of FPT University |
| Note Taker: | TrungVT | | |
| 1. Meeting Objective: | | | |

| | | | |
|--|------------------|--|---------------------------|
| Meeting/Project Name: | Amazing Bike | | |
| Date of Meeting: | 03/22/2016 | Time: (Type) | 2 hours |
| Facilitator: | ThinhNT | Location: | Library of FPT University |
| Note Taker: | TrungVT | | |
| Kick off and create Project Charter. | | | |
| 2. Attendance | | | |
| Name | Roles | E-mail | Phone |
| Nguyễn Trọng Thịnh | Project Manager | ThinhNTSE03170@fpt.edu.vn | 0167 2559 886 |
| Vũ Tiến Trung | Technical Leader | TrungVTSE03102@fpt.edu.vn | 093 4217 251 |
| Trần Văn Tuấn | QA Leader | TuanTVSE03152@fpt.edu.vn | 097 3322 413 |
| Vũ Quang Quyền | Developer | QuyenVQSE03237@fpt.edu.vn | 0167 4092 091 |
| Lưu Ngọc Việt Sơn | Developer | SonLNVSE03711@fpt.edu.vn | 091 2872 336 |
| 3. Content: | | | |
| 1. Kick off meeting. | | | |
| 2. Identify Goals and Objectives. | | | |
| 3. Specify roles and responsibilities. | | | |
| 4. Estimate project budget. | | | |
| 5. Identify main project success criteria. | | | |
| 6. Develop Project Charter. | | | |
| 7. Assign mission for each member. | | | |
| 8. Set up time for next meeting. | | | |

Table 3 - Meeting Minutes Template

3.3 Coding convention:

The following rules follow:

- The standard rules for developing application using java programmer language to build Android application (<https://source.android.com/source/code-style.html>).
- API Style Guide for Arduino (<https://www.arduino.cc/en/Reference/StyleGuide>).

3.4 Risk manage plan:

| Risk ID | Avoiding plan | Fallback plan | Contingency plan | Schedule |
|----------------|---|--|--|---|
| R1 | - PM need contact to stakeholder so that he can aware of changes ASAP. | - Should prepare a list of other suppliers. | - Use chips, modules from other suppliers with similar functions. | - Project manager. - Contacts, regularly updated information from the suppliers. |
| R2 | - Make budget plan detail at the first step of project. | - Modify budget plan to avoid over budget. | - Minimize expense. - Get money from sponsor. | - Project manager. - Control budget frequency. |
| R3 | - PM should estimate workforce needed for the project and able reserve members if needed. | - Assign clearly jobs based on the capacity of the group members. | - A few excellent members may undertake other work more to complete the project. | - Project manager. - Estimate workforce needed for the project. |
| R4 | - Learning technology clearly before starting project. | - Finding supporting from expert. | - Limit related function. | - Technical Leader and Project manager. - Contact to expert as soon as possible after an issues occurs. |
| R5 | - Should create a schedule in which tasks are divided to suitable members. | - Check deadlines regularly and motivate members to meet the deadline. | - Reprimand, reprove, change member if necessary. | - Project manager and QA leader. - Check deadline regularly. |
| R6 | - Training members. | - Support members. | - Changing members. | - Technical Leader and members. - Training members in 1 week after kick off project. - Supporting members: member has technical issues. |

| | | | | |
|----|---|--|----------------------------------|--|
| R7 | - Hiring member appropriately | - Setting common rule | Meeting to identify common goal | - Project manager and QA leader - Organizing daily and weekly meeting |
| R8 | - PM should discuss with developer team to find solution. | - Testing new technologies, modern equipment | - Finding supporting from expert | - Project manager and team member. - Organizing important meeting. |

Table 4- Risk Management Plan

3.5 Communication plan:

- **Weekly meeting schedule:** By using Iterative and Incremental Process Model, we have weekly meeting to review, update and solve all problems that team has to face during working time. It's often occurred on Tuesday or Thursday at the library of FPT University.

Beside of discussing some current issues, this is team time for all members can fix problems together. On the other hand, technical leader can help others with technical problem and keep track working process.

- **Unscheduled meeting:** If someone has an important problem want to be solved immediately, he/she can propose to Project Manager to hold urgent meeting.
- **Communication channel:** Our main communication channels are physical meeting, email. However, we often have phone call or skype calling meeting.

III. Software requirement specification (SRS):

1. Purpose:

This chapter outlines functional and non – functional requirements of our website. It also provides some format constraints in common requirements and project success criteria. All members will work (design, code, test) based on the information provided in this chapter.

2. External Interface Requirements:

2.1 User Interface:

The interface must be designed to be satisfied the following requirement:

- The interface is divided by tabs, which will allow users to easily switch between different parts of the program.
- Be simple and user-friendly.
- Meet all the main functions and easily to identify each of functions.
- Use obvious icons to avoiding misunderstanding.

2.2 Hardware Interface:

The hardware interfaces the robot using must be designed to be satisfied the following requirement:

- Low-cost hardware module.
- Easy to consume.
- Easy to replace for maintenance.

2.3 Communication Protocols:

With the robot and the android application, we must use Serial Port Protocol (SPP) to connect each other, via Bluetooth Module of PC and HC-05 Bluetooth Module on the robot.

With the self-balance bike and the android application, we use radio wave to connect them because the distance from the mobile to the bike is far.

3. Functional Requirements:

3.1 Use Case Diagram:

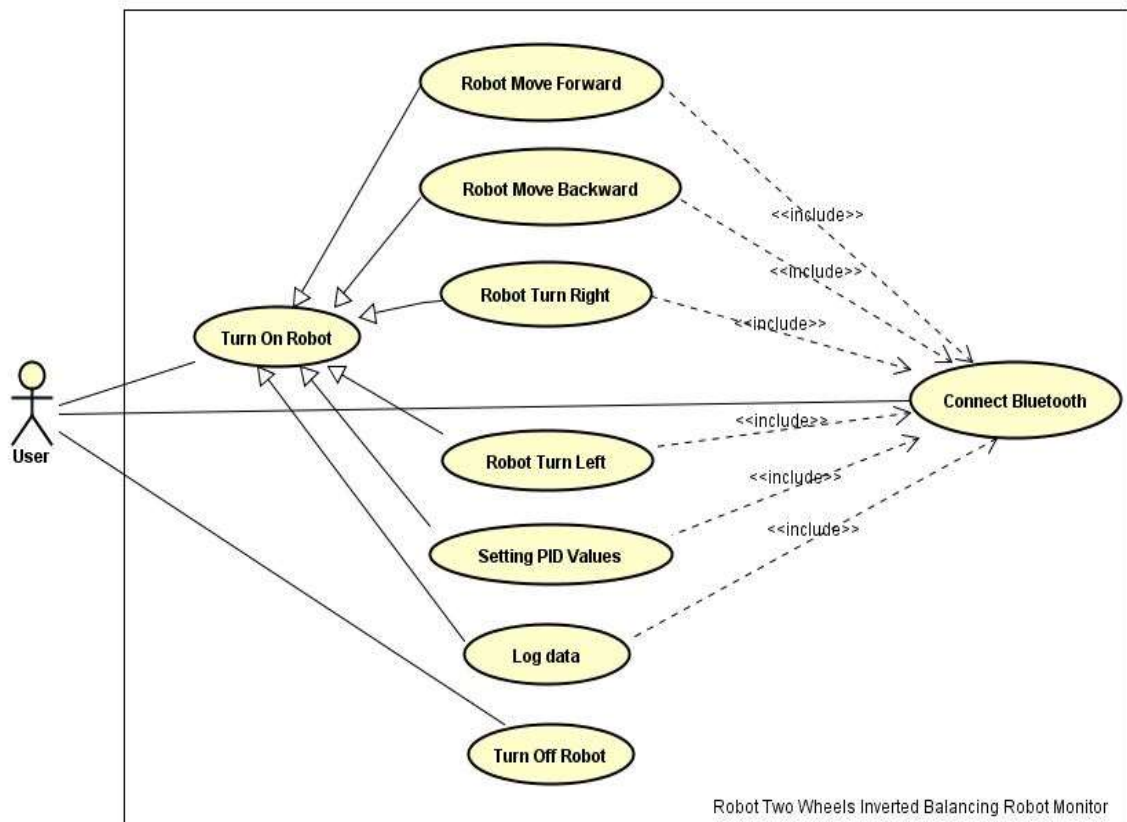

Figure 11 – Use case Diagram Robot Two Wheels

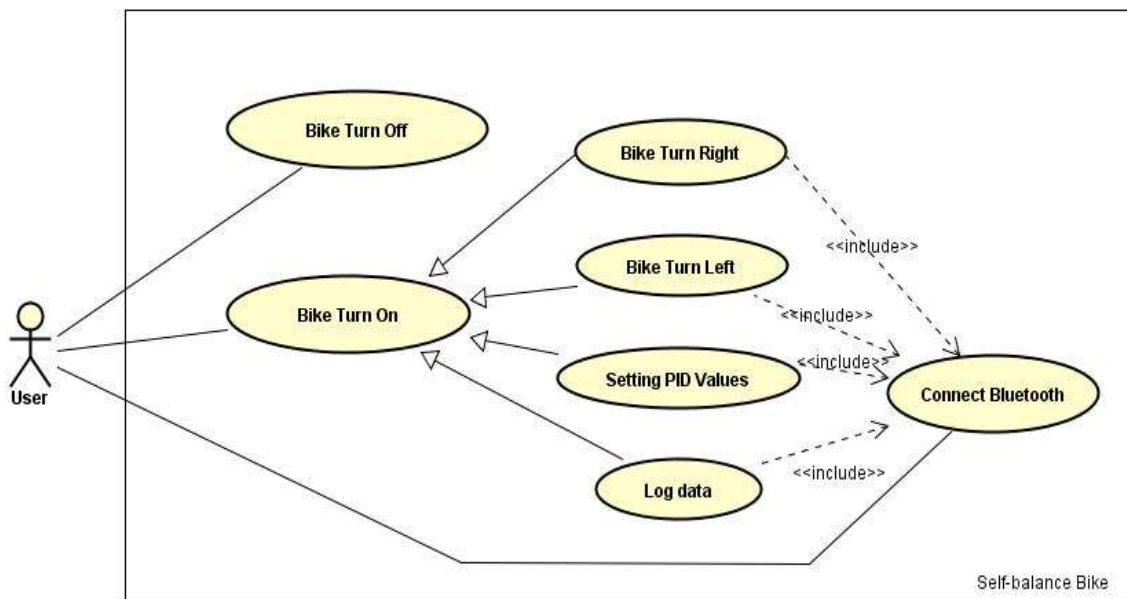

Figure 12 - Use case Self-balance Bike

3.2 Use Case Lists:

3.2.1 Robot two wheels:

| No | Function No | Function Name | Description |
|----|-------------|----------------------|---|
| 1 | R2W01 | Robot turn On. | Start the robot, robot can keep self-balance state. |
| 2 | R2W02 | Robot turn Off. | Turn off the motor, robot stops run. |
| 3 | R2W03 | Connect Bluetooth. | Connect the robot with android application via Bluetooth. |
| 4 | R2W04 | Setting PID values. | Set PID parameters for robot from mobile phone that uses android platform. |
| 5 | R2W05 | Robot move forward. | Control the robot to move ahead. |
| 6 | R2W06 | Robot move backward. | Control the robot to move rearwards. |
| 7 | R2W07 | Robot turn right. | Control the robot to turn right. |
| 8 | R2W08 | Robot turn left. | Control the robot to turn left. |
| 9 | R2W09 | Log data | Display the information about angle, PID values on the mobile screen application. |

Table 5 - Robot two wheels Use case

3.2.2 Self-Balance Bike:

| No | Function No | Function Name | Description |
|----|-------------|--------------------|---|
| 1 | SBB01 | Connect Bluetooth | Connect the bike with android application via Bluetooth. |
| 2 | SBB02 | Bike turn On | Start the motor, bicycle auto moving ahead. |
| 3 | SBB03 | Bike turn Off | Turn off the motor, bicycle stops moving. |
| 4 | SBB04 | Setting PID values | Set PID parameters automatically that passed from the mobile. |
| 5 | SBB05 | Bike turn right | Control the bicycle to turn right. |
| 6 | SBB06 | Bike turn left | Control the bicycle to turn left. |
| 7 | SBB07 | Log data | Display the information about angle, PID values on the mobile screen application. |

Table 6 - Self-Balance Bike Use case

3.3 Use Cases:

3.3.1 Robot turn on:

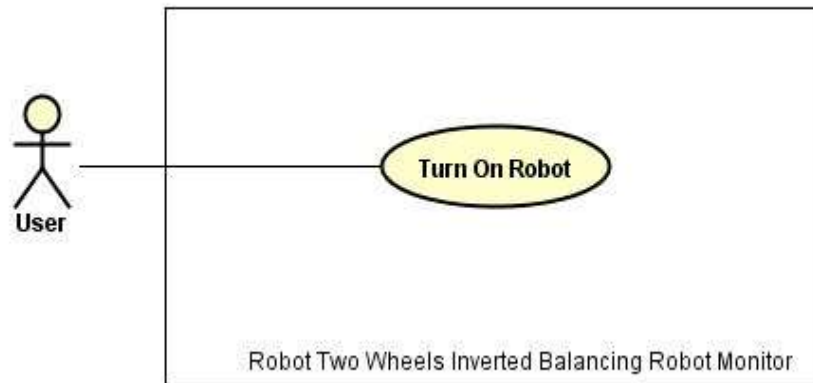

Figure 13- Use case Turn on Robot

| Use Case ID | | R2W01 | Use Case Name | | Robot turn On | |
|-------------------|--|--|--------------------------|-----|---------------|------------|
| Author | | SonLNV | Version | 0.1 | Date | 07/11/2016 |
| Actor | | User | | | | |
| Description | | User start the robot. | | | | |
| Precondition | | N/A | | | | |
| Trigger | | User turn on the starting switch on the robot. | | | | |
| Post-Condition | | The robot is started and can keep self-balance standing state. | | | | |
| Main flows | | | | | | |
| Step | Actor | Action | | | | |
| 1 | User | User press starting button on the robot. | | | | |
| 2 | System Response | Robot is ON. | | | | |
| Alternative flows | | | | | | |
| N/A | | | | | | |
| Exceptions | | | | | | |
| No | Actor Action | | System Response | | | |
| 1 | • The robot hasn't yet fully fitted mains (power). | | The robot doesn't start. | | | |

4. Non-functional Requirements:

4.1 Reliability:

- There is at least 99.9% of user command that will be successfully sent to the robot.
- The robot has to stay balance when it does not receive any disturbance.
- Balancing accuracy of PID algorithms is at least 99 % (The balancing angle is degree) when it does not receive any external disturbance.
- The robot must be able to return to balance state when it receives any external forces.

4.2 Availability:

- User can operate the robot successfully using two wheeled inverted balancing robot monitor whenever the robot is on and available to connect through Bluetooth.

4.3 Security:

- N/A

4.4 Maintainability:

- Flexible mechanical designing to make it easy to replace any robot components.
- The hardware components are all available, and easy to purchase in Viet Nam.
- The system is divided into separate modules (TWIBR, TWIBR Monitor) - The firmware code and software code is easy to maintain and upgrade.

4.5 Portability:

- N/A.

4.6 Performance:

- Robot has to response one user command in less than 0.5 second.
- Robot has to reach balance state in less than 3 seconds after it received an external force.

IV. Research and study:

1. PID:

Figure 29 - A block diagram of a PID controller in a feedback loop

Proportional-Integral-Derivative (PID) control is the most common control algorithm used in industry and has been universally accepted in industrial control.

The popularity of PID controllers can be attributed partly to their robust performance in a wide range of operating conditions and partly to their functional simplicity, which allows engineers to operate them in a simple, straightforward manner.

$$u(t) = K_p e(t) + K_i \int_0^t e(\tau) d\tau + K_d \frac{de(t)}{dt}$$

Figure 30 - PID algorithm

With K_p , K_i , and K_d , all non-negative, denote the coefficients for the proportional, integral, and derivative terms, respectively (sometimes denoted P , I , and D).

In this model,

- P accounts for present values of the error. For example, if the error is large and positive, the control output will also be large and positive.
- I accounts for past values of the error. For example, if the current output is not sufficiently strong, error will accumulate over time, and the controller will respond by applying a stronger action.
- D accounts for possible future values of the error, based on its current rate of change.

As a PID controller relies only on the measured process variable, not on knowledge of the underlying process, it is broadly applicable. By tuning the three parameters of the model, a PID controller can deal with specific process requirements. The response of the controller can be described in terms of its responsiveness to an error, the degree to which the system overshoots a set point, and the degree of any system oscillation. The use of the PID algorithm does not guarantee optimal control of the system or even its stability.

2. Ziegler-Nichols method:

The Ziegler–Nichols tuning method is a heuristic method of tuning a PID controller. It was developed by John G. Ziegler and Nathaniel B. Nichols. It is performed by setting the

I (integral) and **D** (derivative) gains to zero. The "**P**" (proportional) gain, K_p is then increased (from zero) until it reaches the ultimate gain K_u , at which the output of the control loop has stable and consistent oscillations. K_u and the oscillation period T_u are used to set the P, I, and D gains depending on the type of controller used:

| Ziegler–Nichols method | | | |
|------------------------|------------|-------------|--------------|
| Control Type | K_p | T_i | T_d |
| P | $0.5 K_u$ | - | - |
| PI | $0.45 K_u$ | $T_u / 1.2$ | - |
| PD | $0.8 K_u$ | - | $T_u / 8$ |
| Classic PID | $0.6 K_u$ | $T_u / 2$ | $T_u / 8$ |
| Pessen Integral Rule | $0.7 K_u$ | $T_u / 2.5$ | $3 T_u / 20$ |
| Some overshoot | $0.33 K_u$ | $T_u / 2$ | $T_u / 3$ |
| No overshoot | $0.2 K_u$ | $T_u / 2$ | $T_u / 3$ |

Table 7 - Ziegler-Nichols method

3. MPU6050:

Figure 31 - MPU6050

3.1 Specifications:

- MPU-6050 module (3-axis gyroscope + 3-axis accelerometer)
- Chip: MPU-6050
- Input voltage: 3-5V
- Standard communication interface: I2C
- Chip 16bit AD converter, 16-bit data Output
- Gyro full-scale range: ± 250 ± 500 ± 1000 ± 2000 $^{\circ}/s$
- Accelerometer full-scale range: ± 2 ± 4 ± 8 $\pm 16g$
- Standard jack: 2.54mm

3.2 Description:

MPU6050 is one of the first motion sensor in the world with up to 6 axes (expandable to 9-axis) sensors integrated in a single chip.

MPU-6050 uses MotionFusion proprietary technology of InvenSense that can run on mobile devices, controllers.

MPU-6050 integrated 6-axis sensors:

- 3-axis MEMS gyroscope.
- 3-axis MEMS accelerometer.

In addition, the MPU-6050 also has one unit dedicated hardware acceleration signal processing (Digital Motion Processor - DSP) collected by the sensor and perform the necessary calculations. This helps to significantly reduce calculation processing portion of the microcontroller, improve processing speed and for a faster response. This is one significant difference compared between the MPU-6050 with accelerometer and gyro sensors others.

MPU6050 can be combined with a magnetic field sensor (outside) to form the sensor 9 full angle via I2C interface.

3.3 Estimating the inclination angle with an Accelerometer:

Figure 32 - Inclination angle calculation

Suppose that the robot is falling as illustrated above. The inclination angle can be calculated as:

$$\theta = \tan^{-1} \frac{A_x}{A_y} = \sin^{-1} \frac{A_x}{\sqrt{A_x^2 + A_y^2}} = \sin^{-1} \frac{A_x}{g}$$

In the equation above, A_x is the x axis, A_y is the y axis that are the accelerometer reading on its x axis & y axis. When the robot is stationary, g is the gravitation constant.

In this case, because we are only interested in calculations where the inclination angle is small since our goal is to ensure that the deviation from balance is as small as possible, so further simply the equation:

$$\theta \approx \sin(\theta) = \frac{A_x}{g} \quad \dots (1)$$

By only measuring the x axis reading, we can get a raw estimate of the inclination angle in case assumption that the robot is standing still. In fact, when the robot isn't in balance it will accelerate towards the direction it's falling and thus the x axis reading will be slight more than A_x due to the acceleration. At the same time, the y axis reading will be slight less than A_y . As a result, the combined vector will deviate from g . But when the accelerometer is placed near the center of gravity of the robot, the acceleration along the x axis is small in near-balance condition. So the above equation will exhibit some small error, but it remains a good approximation of the inclination angle.

3.4 Estimating the inclination angle with a Gyroscope:

Gyroscope can measure the rate at which the rotation is taking place. And the rotation angle for a given time interval is governed by:

$$\theta(t) = \int_{t_1}^{t_2} G(t) dt$$

Where $G(t)$ is the gyroscope reading with respect to the rotation direction. When the time interval is small enough, the gyroscope reading can be treated as a constant and thus the above equation can be approximated as:

$$\theta(t) \approx \theta(t_1) + G(t)(t_2 - t_1) = \theta(t_1) + G(t)\Delta t \quad \dots (2)$$

Unlike the accelerometer, gyroscope measurement is largely immune to none angular movement and thus far less susceptible to vibrations and lateral accelerations mentioned previously. But since the angular measurement is cumulative, any minute error in measurements will manifest over time which causes the estimated angle to deviate from the true value. This is the so called drifting effect. Thus gyroscope alone cannot be used to reliably measure the inclination angle either.

3.5 Sensor fusion:

To address the issue of measurement noises and the limitations of measurements by either the accelerometer or gyroscope alone, we will need to combine the readings from both the accelerometer and the gyroscope in a meaningful way so that we could use the strengths from both sensors to obtain a more accurate result than either measurement alone could provide. This is the classic application of sensor fusion. Since accelerometers can provide accurate angle calculations when there is no acceleration and gyroscope can provide accurate short-time angle measurements? These complementary traits are ideal candidates for sensor fusion.

Like many processes in the physical world, sensor readings from the accelerometer and the gyroscope can be modelled as the true measurements with added white Gaussian noise (AWGN). Many filters in the least mean square filters family are suitable for this kind of stochastic process.

3.5.1 Kalman filter:

Kalman filter is one such adaptive filters that can be used to filter the sensor data from accelerometer and gyroscope. Even though the implementation of Kalman filter is quite straight forward, in order for the filter to be optimal we needed to know the precise underlying model of the system and we also need to be able to reliably estimate the noise covariance matrices. Without any reliable information on these parameters, the filter may still work but will not be in an optimal sense. Simpler methods can be used in situations where these parameters are unknown and can still achieve reasonably good result.

So, to keep the implementation simple, we used the method illustrated below where the estimated value is a linear combination of the filtered measurements from both the accelerometer and the gyroscope. Each sensor reading is multiplied by a fixed gain:

Figure 33 - Accelerometer and Gyroscope diagram

From the diagram above, we can see that in order to make the accelerometer readings more reliable, the readings are passed through a low pass filter (e.g. averaging over time) to

smooth out any sudden change in values. And the gyroscope readings are integrated and then added to the previous estimate to give the current inclination angle reading. Each of the component is weighted and then added together to give the final estimate. Mathematically, the estimated angle can be expressed as follows:

$$\begin{cases} \theta_{est} |_{t_2} = \alpha(\theta_{est} |_{t_1} + G\Delta t) + \beta\theta_{Ax} & \dots (3) \\ \alpha + \beta = 1 & \dots (4) \end{cases}$$

Figure 34 - Calculation formula

Where G is the gyroscope reading and angle Ax is the angle calculated from the accelerometer reading in equation (1) above.

Figure 35 - Kalman Filter Data

But Kalman filter has some disadvantages for self-balancing system:

- Very complex to understand.
- Very hard, if not impossible, to implement on certain hardware (8-bit microcontroller etc.)
- Needs to calculate the coefficients of the matrices, the process-based error, measurement error, etc. that are not trivial.

3.5.2 Complementary filter:

In fact, Complementary filter manage both high-pass and low-pass filters simultaneously. The low pass filter filters high frequency signals (such as the accelerometer in the case of vibration) and low pass filters that filter low frequency signals (such as the drift of the gyroscope). In other words, on the short term, we use the data from the gyroscope, because it is very precise and not susceptible to external forces. On the long term, we use the data from the accelerometer, as it does not drift. By combining these filters, we get a good signal, without the complications of the Kalman filter. In its most simple form, the filter looks as follows:

$$angle = 0.98 * (angle + gyrData * dt) + 0.02 * (accData)$$

The gyroscope data is integrated every timestep with the current angle value. After this it is combined with the low-pass data from the accelerometer (already processed with atan2). The constants (0.98 and 0.02) have to add up to 1 but can of course be changed to tune the filter properly.

The data result come from Complementary filter:

Figure 36 – Complementary Filter Data

As we see, the filter is very easy and light to implement making it perfect for embedded systems.

3.5.3 Digital Motion Processor:

Beside above filters, we also can use the embedded Digital Motion Processor (DMP) is located within the MPU-6050 to fusion data from accelerometers, gyroscopes and processes them. The resulting data can be read from the DMP's registers, or can be buffered in a FIFO (a buffer inside MPU - 6050). The DMP has access to one of the MPU's external pins, which can be used for generating interrupts.

Figure 37 – DMP Data

The purpose of the DMP is to offload both timing requirements and processing power from the host processor. The DMP can be used as a tool in order to minimize power, simplify timing, simplify the software architecture, and save valuable MIPS on the host processor for use in the application.

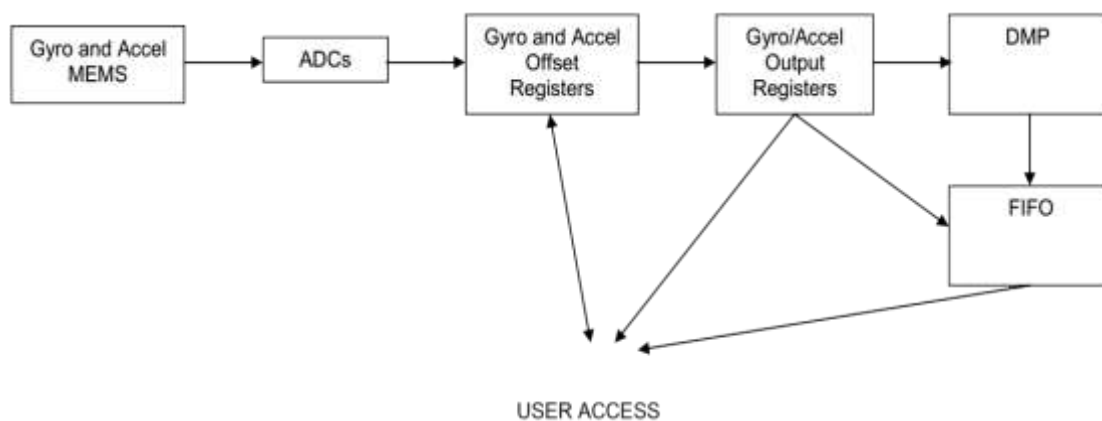

Figure 38 - Data Signal Diagram

3.5.4 Finding out the offsets:

Offsets are caused by a number of factors such as mechanical assembly, mounting, package damage and temperature fluctuations. So we need to work out what the offsets of our chip are and then remove them before processing the data. This can be very significant for many applications. The offset error alone can affect a tilt reading on a flat surface by as much as 12 degrees.

Let assign data from accelerometer, gyroscope A_x , A_y , A_z , G_x , G_y , G_z respectively. When we place MPU6050 in horizontal position so our data must be zero with A_x , A_y , G_x , G_y , G_z and the remain A_z equal 1G (16384 for default sensitivity). After that we measure the average acceleration and gyroscope over 10-20 samples and anything over 0G in the A_x , A_y , G_x , G_y , G_z and 1G in A_z will be our offsets.

3.5.5 Conclusion:

We can see the data comes from DMP is little better than Kalman filter's data and Complementary filter's data. So we decide to use DMP to be main data fusion in this project.

3.6 Communication:

In this system, we have a lot of modules so we need to help them to communicate with each other.

Figure 39 - Modules and Protocols

3.6.1 I2C:

I2C is a serial protocol for two-wire interface to connect low-speed devices like microcontrollers, EEPROMs, A/D and D/A converters, I/O interfaces and other similar peripherals in embedded systems.

I2C uses only two wires: SCL (serial clock) and SDA (serial data). Both need to be pulled up with a resistor to +Vdd. There are also I2C level shifters which can be used to connect to two I2C buses with different voltages.

Basic I2C communication is using transfers of 8 bits or bytes. Each I2C slave device has a 7-bit address that needs to be unique on the bus. Some devices have fixed I2C address while others have few address lines which determine lower bits of the I2C address. This makes it very easy to have all I2C devices on the bus with unique I2C address. There are also devices which have 10-bit address as allowed by the specification.

7-bit address represents bits 7 to 1 while bit 0 is used to signal reading from or writing to the device. If bit 0 (in the address byte) is set to 1 then the master device will read from the slave I2C device.

In normal state both lines (SCL and SDA) are high. The communication is initiated by the master device. It generates the Start condition (S) followed by the address of the slave device (B1). If the bit 0 of the address byte was set to 0 the master device will write to the slave device (B2). Otherwise, the next byte will be read from the slave device. Once all bytes are read or written (Bn) the master device generates Stop condition (P). This signals to other devices on the bus that the communication has ended and another device may use the bus.

Most I2C devices support repeated start condition. This means that before the communication ends with a stop condition, master device can repeat start condition with address byte and change the mode from writing to reading.

3.6.2 *UART and Bluetooth:*

The Universal Asynchronous Receiver/Transmitter (UART) controller is the key component of the serial communications subsystem of a computer. The UART takes bytes of data and transmits the individual bits in a sequential fashion. At the destination, a second UART re-assembles the bits into complete bytes. UART uses two wire to transfer data : RX, TX.

Bluetooth is a wireless technology standard for exchanging data over short distances. It's available on smartphone, so we use it to communicate with Android application.

4. Arduino Mega 2560:

Figure 40 - Arduino Mega 2560

Technical specs:

| | |
|-----------------------------|---|
| Microcontroller | ATmega2560 |
| Operating Voltage | 5V |
| Input Voltage (recommended) | 7-12V |
| Input Voltage (limit) | 6-20V |
| Digital I/O Pins | 54 (of which 15 provide PWM output) |
| Analog Input Pins | 16 |
| DC Current per I/O Pin | 20 mA |
| DC Current for 3.3V Pin | 50 mA |
| Flash Memory | 256 KB of which 8 KB used by bootloader |
| SRAM | 8 KB |
| EEPROM | 4 KB |
| Clock Speed | 16 MHz |
| Length | 101.52 mm |
| Width | 53.3 mm |
| Weight | 37 g |

The Mega 2560 is a microcontroller board based on the ATmega2560. It has 54 digital input/output pins (of which 15 can be used as PWM outputs), 16 analog inputs, 4 UARTs (hardware serial ports), a 16 MHz crystal oscillator, a USB connection, a power jack, an ICSP header, and a reset button. It contains everything needed to support the microcontroller; simply connect it to a computer with a USB cable or power it with an AC-

to-DC adapter or battery to get started. The Mega 2560 board is compatible with most shields designed for the Uno and the former boards Duemilanove or Diecimila.

5. Module Control Engine L298:

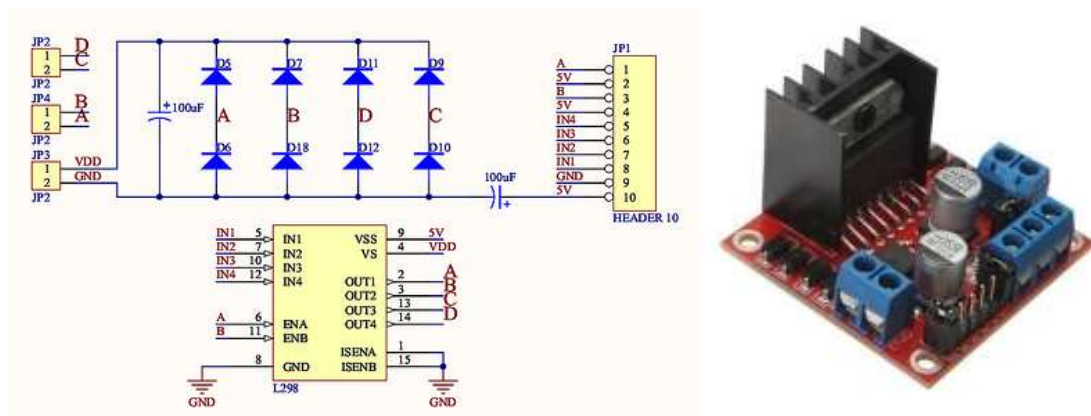

Figure 41 - L298

5.1 Specifications:

- Driver: L298N integrated dual H-bridges.
- Power supply: +5 V ~ +35 V
- Peak output current per channel: 2A
- Logic power output Vss: +5 V ~ +7 V
- Logic current: 0 ~ 36ma
- Max power: 20W(Temperature 75 Cesus)
- Working temperature: -25 °C ~ +130 °C

5.2 Description:

The L298 is an integrated monolithic circuit in a 15-lead Multiwatt and PowerSO20 packages. It is a high voltage, high current dual full-bridge driver designed to accept standard TTL logic levels and drive inductive loads such as relays, solenoids, DC and stepping motors. Two enable inputs are provided to enable or disable the device independently of the input signals. The emitters of the lower transistors of each bridge are connected together and the corresponding external terminal can be used for the connection of an external sensing resistor. An additional supply input is provided so that the logic works at a lower voltage.

Summary function pins of the L298:

- 4 pins INPUT: IN1, IN2, IN3, IN4 connected in turn with pins: 5, 7, 10, and 12 of L298. This is the control signal pins.
- 4 pins OUTPUT: OUT1, OUT2, OUT3, OUT4 (correspond with INPUT pins) connected in turn with pins: 2, 3, 13, and 14 of L298. These pins are connected to the motor.
- ENA and ENB pins used to control the L298 H-bridge circuit. If at logic "1" (powered with 5V) allowing H-bridge circuit operation, if at logic "0", the H-bridge circuit is not working

With our math above, you just need to pay attention to how to control the direction of rotation with L298:

- ENA = 0: Motor doesn't rotate with all inputs.
- ENA = 1:
 - INT1 = 1; INT2 = 0: Motor moves forward.
 - INT1 = 0; INT2 = 1: Motor moves reverse.
 - INT1 = INT2: Fast Motor stops
- ENB similar with INT3, INT4

6. Module Control Engine 43A BTS7960:

Figure 42 - Module Control Engine 43A BTS7960

This driver uses Infineon chips BTS7960 composed of high-power drive full H-bridge driver module with thermal over-current protection. Double BTS7960 H-bridge driver circuit, with a strong drive and braking, effectively isolating the microcontroller and motor driver! High-current 43A.

6.1 Specification:

- Double BTS7960 large current (43 A) H bridge driver.
- 5V isolate with MCU, and effectively protect MCU.
- 5V power indicator on board.
- Voltage indication of motor driver output end.
- Can solder heat sink.
- Just need four lines from MCU to driver module (GND. 5V. PWM1. PWM2).
- Isolation chip 5 V power supply (can share with MCU 5 V).
- Able to reverse the motor forward, two PWM input frequency up to 25kHz.
- Two heat flow passing through an error signal output.
- Isolated chip 5V power supply (can be shared with the MCU 5V), can also use the on-board 5V supply.
- The supply voltage: 5.5V to 27V.

6.2 Pinout:

- VCC: Power Control (5V - 3V3)
- GND: Pin negative.
- R_EN = 0: Disable half H-bridge must.
- R_EN = 1: Enable half H-bridge must.
- L_EN = 0: Disable the left half of the H-bridge.
- L_EN = 1: Enable half H-bridge left.
- RPWM and LPWM: pin reverse controls and engine speed.
- RPWM = 1 and LPWM = 0: Motor forward rotation.
- LPWM RPWM = 0 and = 1: Motor reverse running
- RPWM = 1 and LPWM = 1 or RPWM = 0 and LPWM = 0: Stop.
- R_IS and L_IS: combined with resistor to limit the current through the H-bridge

7. Module Bluetooth HC06:

Figure 43 – Module Bluetooth HC06

SLAVE Bluetooth module allows microcontroller connected to the peripheral device: smartphone, laptop, Bluetooth usb ... sending and receiving two-way signals through Serial communication.

Bluetooth module integrated on the board allows you to use from 3.5V to 6V power supply board without worrying about voltage difference 3V - 5V may damage the board.

Bluetooth module includes in the order of 6 pins: KEY, VCC, GND, TX, RX, STATE

This is the Bluetooth module SLAVE means you cannot actively connected with the microcontroller, which need to use smartphone, laptop, Bluetooth usb... to detect a signal and connect (pair) from a smartphone, laptop, Bluetooth usb... After pair successfully, you can send and receive signals from the microcontroller to the devices.

8. Gear motors 12V 116RPM GH-1632T:

Figure 44 - Gear motors 12V 116RPM GH-1632T

Specifications:

Output: 2W

Voltage: 12V

Field No Download: 70mA

Speed: 116RPM 12V

Speed over voltage: 5-> 15V speed 48-> 145RPM

Weight: 120 g

9. Physical theory:

Figure 45 - Principles of operation of bicycles

A - Direction that the vehicle is straight forward.

B - Gravity.

C - Centripetal force.

D - Centrifugal force.

Handling a vehicle in equilibrium based on the principle as follows:

When the vehicle is inclined against the equilibrium position, it should have a force large enough to pull the vehicle from the inclined angle back to its original state. In fact, there is a common method called gyroscopes. However, it is found that the method is relatively common and needs a quite bulky model; therefore, our group do not perform in this way.

According to the theory of centrifugal force and empirical observations, when the vehicle is inclined, if the steering wheel is inclined towards the vehicle's direction, it will generate a centrifugal force pulling the vehicle towards the opposite direction. Thus, the goal of our group is to use the control algorithm PID to adjust the vehicle's rotation angle so that the centrifugal force is adequate and accurate. The ultimate aim is to keep the vehicle balance.

V. Software Design Description (SDD):

1. Purpose:

This document describes a general view of system which includes:

- System architectural design which describes system's model, system's layers, layer's component and the function of each layer.
- The detailed description of components and the relationship between each component.
- Sequence diagram to know how to the system run.
- User Interface design which describes system's screens and how users interact to systems. Each screen includes functions, types of input/ output and event handling.

2. Architecture Overview:

Robot two wheels self-balancing:

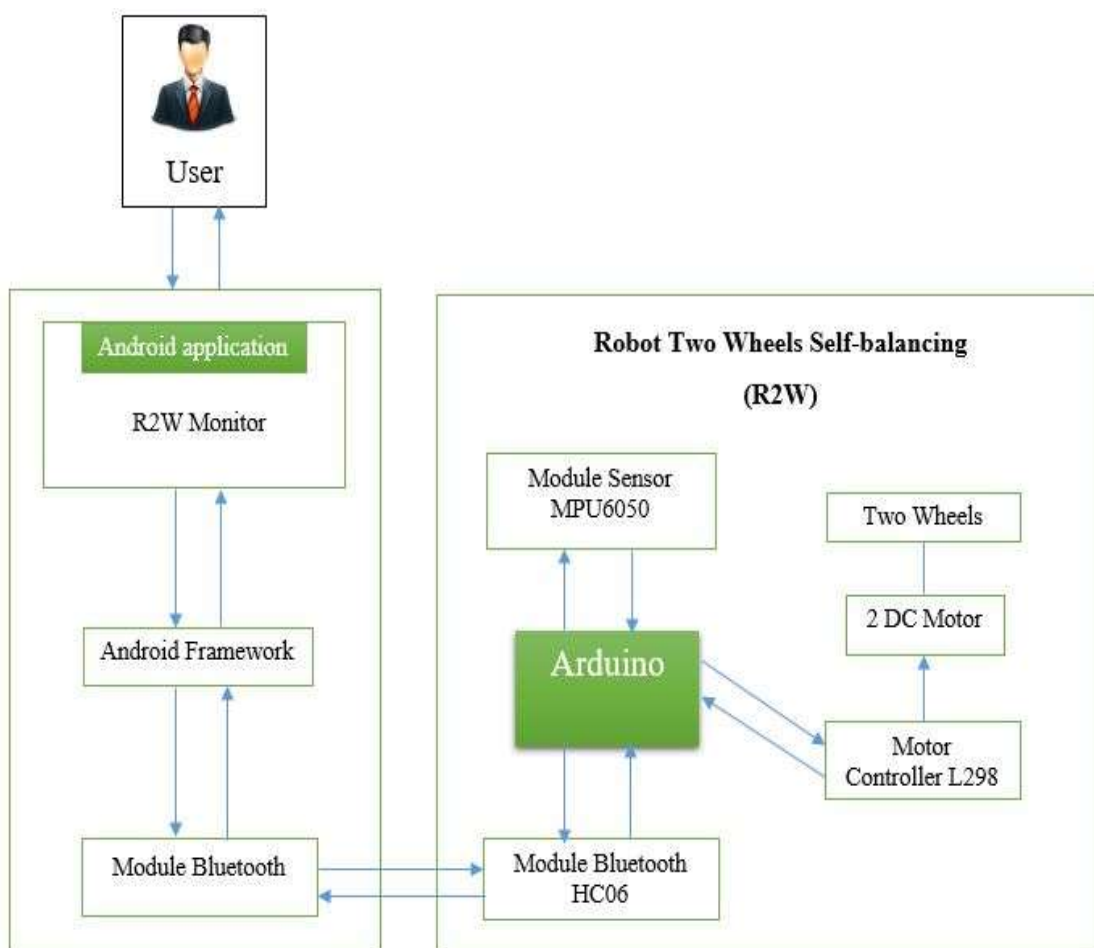

Figure 46 - System Architecture Diagram of R2W

Self-balancing Bike:

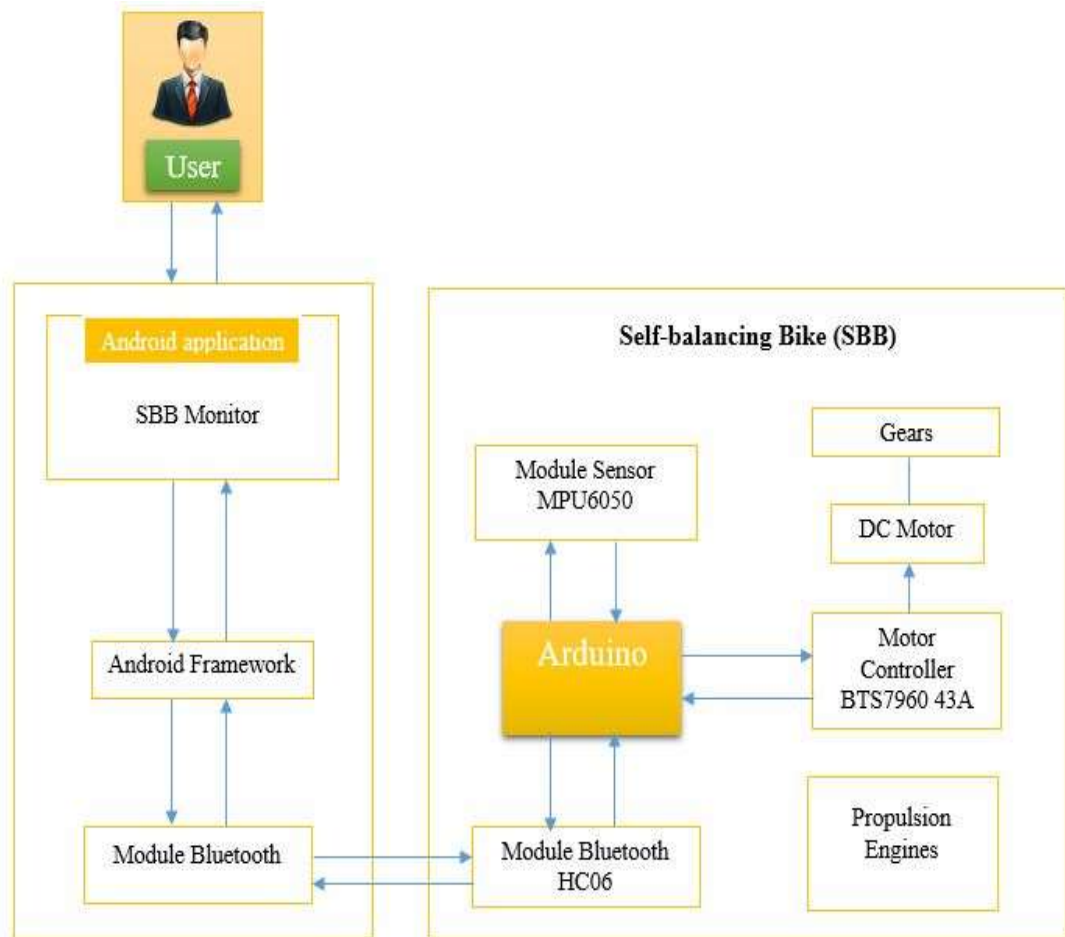

Figure 47 - System Architecture Diagram of SBB

Figure 48 - Wire diagram

3. Class Diagram:

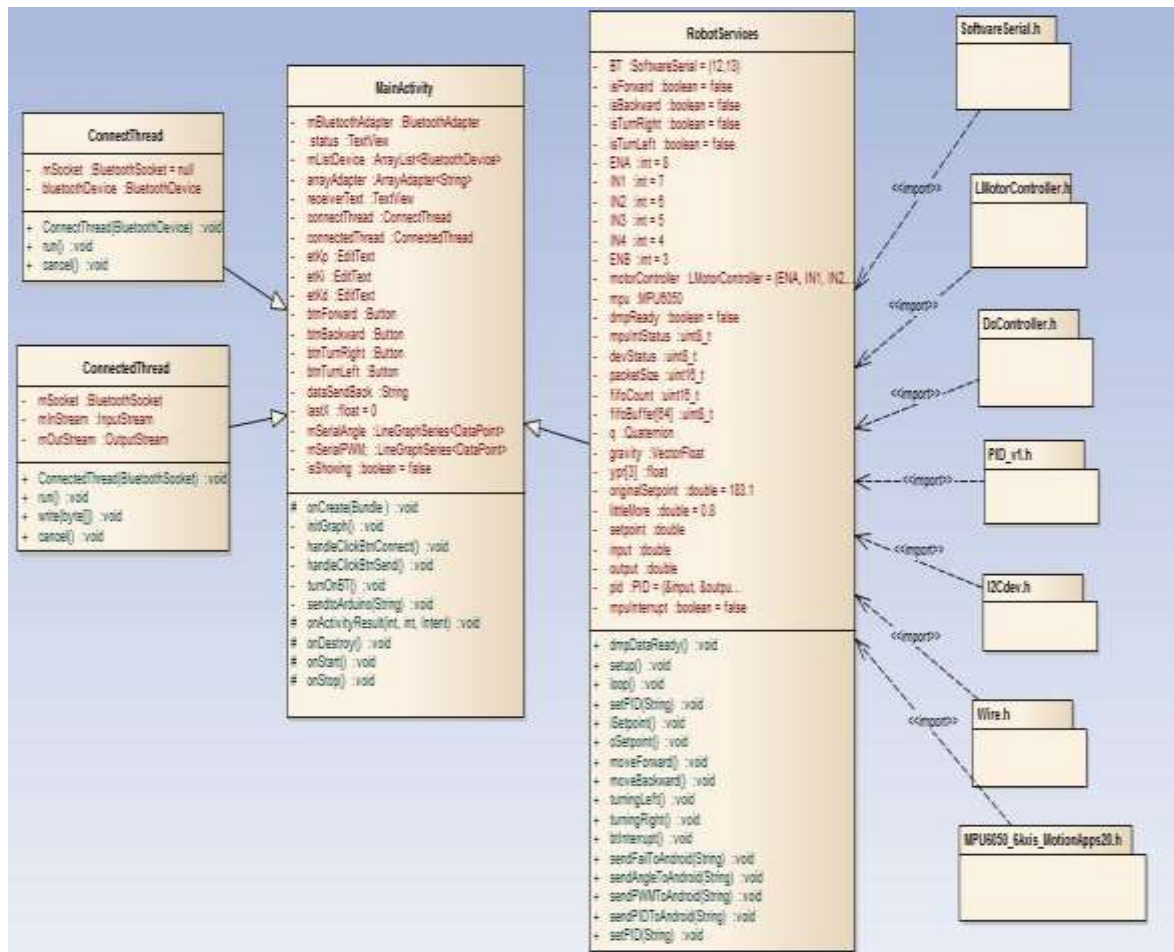

Figure 49 - Class Diagram

| Main Activity | | | |
|-------------------|----------------------------|------------|---|
| Attributes | | | |
| Name | Type | Initialize | Description |
| mBluetoothAdapter | BluetoothAdapter | | Represent the local device Bluetooth adapter. |
| status | TextView | | The current status of Bluetooth connection. |
| mListDevice | ArrayList<BluetoothDevice> | | List the device searched by Bluetooth |

| | | | |
|--------------------|----------------------------|--------------|---|
| arrayAdapter | ArrayAdapter<String> | | Adapter for dialog. |
| receiverText | TextView | | Log data received from Arduino. |
| connectThread | ConnectThread | | Background Thread to handle Bluetooth connecting. |
| connectedThread | ConnectedThread | | Background Thread to handle Bluetooth connected. |
| etKp | EditText | | Input value of K_p |
| etKi | EditText | | Input value of K_i . |
| etKd | EditText | | Input value of K_d . |
| btnForward | Button | | Forward button. |
| btnBackward | Button | | Backward button. |
| btnTurnLeft | Button | | Turn left button. |
| btnTurnRight | Button | | Turn right button. |
| dataSendBack | String | | Storing data that has sent. |
| mSerialAngle | LineGraphSeries<DataPoint> | | Data for graph of angle. |
| mSerialPWM | LineGraphSeries<DataPoint> | | Data for graph of pulse. |
| isShowing | boolean | false | The displays status of the dialog. |
| btHandler | Handler | | Receive data from Bluetooth and handling. |
| listener | View.OnClickListener | | Receive the event of the button click. |
| mBrbt | BroadcastReceiver | | Receive the intent from Bluetooth module. |
| Methods | | | |
| Method Name | onCreate | Scope | Protected |

| Return | Return Type | Description | |
|--------------------|-----------------------|--|---------|
| N/A | None | Initialize basic variables. | |
| Parameter | Type | Default Value | |
| savedInstanceState | Bundle | | |
| Method Name | initGraph | Scope | Private |
| Return | Return Type | Description | |
| Signal | Int | Initialize the graphs. | |
| Parameter | Type | Default Value | |
| Input | Double | | |
| Method Name | handleClickBtnConnect | Scope | Private |
| Return | Return Type | Description | |
| N/A | None | Handling event click of the Connect button | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | handleClickBtnSend | Scope | Private |
| Return | Return Type | Description | |
| N/A | None | Handling event click of the Send button | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | turnOnBT | Scope | Private |
| Return | Return Type | Description | |
| N/A | None | Check current status of the device, if it off turn it on | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | sendtoArduino | Scope | Private |
| Return | Return Type | Description | |

| | | | |
|--------------------|------------------|--|-----------|
| N/A | None | Convert String into bytes to send to Arduino | |
| Parameter | Type | Default Value | |
| msg | String | | |
| Method Name | onActivityResult | Scope | Protected |
| Return | Return Type | Description | |
| N/A | None | Receive results from enabled Bluetooth. | |
| Parameter | Type | Default Value | |
| requestCode | Int | | |
| resultCode | Int | | |
| data | Intent | | |
| Method Name | onDestroy | Scope | Protected |
| Return | Return Type | Description | |
| N/A | None | Destroy Bluetooth connection. | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | onStart | Scope | Protected |
| Return | Return Type | Description | |
| N/A | None | Attach Broadcast Receiver | |
| Para N/A meter | Type | Default Value | |
| N/A | None | | |
| Method Name | onStop | Scope | Protected |
| Return | Return Type | Description | |
| N/A | None | No attach Broadcast Receiver | |
| Parameter | Type | Default Value | |
| N/A | None | | |

| Connect Thread | | | |
|-----------------|-----------------|-----------------------|------------------------------------|
| Attributes | | | |
| Name | Type | Initialize | Description |
| mSocket | BluetoothSocket | null | Socket of Bluetooth. |
| bluetoothDevice | BluetoothDevice | | Bluetooth devices need to connect. |
| Methods | | | |
| Method Name | ConnectThread | Scope | Private |
| Return | Return Type | Description | |
| N/A | None | Initialize class. | |
| Parameter | Type | Default Value | |
| Device | BluetoothDevice | | |
| Method Name | run | Scope | Public |
| Return | Return Type | Description | |
| N/A | None | Make a connection. | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | cancel | Scope | Public |
| Return | Return Type | Description | |
| N/A | None | Make a disconnection. | |
| Parameter | Type | Default Value | |
| N/A | None | | |

| Connected Thread | | | |
|------------------|-----------------|------------|-----------------------------|
| Attributes | | | |
| Name | Type | Initialize | Description |
| mSocket | BluetoothSocket | | Socket is already connected |
| mInStream | InputStream | | Input Bluetooth stream data |

| | | | |
|--------------------|-----------------|------------------------------------|------------------------------|
| mOutStream | OutputStream | | Output Bluetooth stream data |
| Methods | | | |
| Method Name | ConnectedThread | Scope | Public |
| Return | Return Type | Description | |
| N/A | None | Initialize class. | |
| Parameter | Type | Default Value | |
| Socket | BluetoothSocket | | |
| Method Name | run | Scope | Public |
| Return | Return Type | Description | |
| N/A | None | Receive data stream from Bluetooth | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | write | Scope | Public |
| Return | Return Type | Description | |
| N/A | None | Transfer data to Bluetooth. | |
| Parameter | Type | Default Value | |
| bytes | byte[] | | |
| Method Name | cancel | Scope | Public |
| Return | Return Type | Description | |
| N/A | None | Make a disconnection. | |
| Parameter | Type | Default Value | |
| N/A | None | | |

| Robot Services | | | |
|----------------|------|------------|-------------|
| Attributes | | | |
| Name | Type | Initialize | Description |

| | | | |
|-----------------|------------------|--------------------------------------|--|
| BT | SoftwareSerial | (12,13) | Set port 12 be RX and port 13 be TX |
| isForward | boolean | false | Check robot is going straight or not. |
| isBackward | boolean | false | Check robot is going backwards or not |
| isTurningLeft | boolean | false | Check robot is turning left or not |
| isTurningRight | boolean | false | Check robot is turning right or not |
| isEnough | boolean | | Check data that has sent from Android |
| ENA | Int | 8 | Set up pin Enable A for L298 |
| IN1 | Int | 7 | Set up pin Input 1 for L298 |
| IN2 | Int | 6 | Set up pin Input 2 for L298 |
| ENB | Int | 3 | Set up pin Enable B for L298 |
| IN3 | Int | 5 | Set up pin Input 3 for L298 |
| IN4 | Int | 4 | Set up pin Input 4 for L298 |
| motorController | LMotorController | (ENA, IN1, IN2, ENB, IN3, IN4, 1, 1) | Through L298 to control motor |
| mpu | MPU6050 | | |
| dmpReady | boolean | false | Set true if DMP initialization was successful |
| mpuIntStatus | uint8_t | | Holds actual interrupt status byte from MPU |
| devStatus | uint8_t | | Return status after each device operation (0 = success, !=0 = error) |
| packetSize | uint8_t | | Expected DMP packet size (default is 42 bytes) |
| fifoCount | uint8_t | | Count of all bytes currently in FIFO |
| fifoBuffer[64] | uint8_t | | FIFO storage buffer |

| | | | |
|--------------------|--------------|--|---|
| q | Quaternion | | [w, x, y, z] quaternion container |
| gravity | VectorFloat | | [x, y, z] gravity vector |
| ypr[3] | Float | | [yaw, pitch, roll] yaw/pitch/roll container and gravity vector |
| originalSetpoint | Double | 183.1 | Setting the balance position of the robot (the angle for the robot is self-balance). |
| littleMore | Double | 0.8 | The angle value for robot can go straight, backward, turn right or turn left. |
| setpoint | Double | | The current angle for robot is self-balance. |
| input | Double | | The tilt angle of the robot |
| output | Double | | Pulse of L298 for motor control |
| pid | PID | (&input, &output, &setpoint, 75, 240, 4, DIRECT) | Class PID |
| mpuInterrupt | Boolean | False | Interrupt signal of the MPU6050 |
| Methods | | | |
| Method Name | dmpDataReady | Scope | Void |
| Return | Return Type | Description | |
| N/A | None | Check availability of data from MPU6050 | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | setup | Scope | Void |
| Return | Return Type | Description | |
| N/A | None | Setting the basic parameters | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | loop | Scope | Void |

| Return | Return Type | Description | |
|-------------|--------------|---------------------------------------|------|
| N/A | None | Execute the command loop | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | btInterrupt | Scope | Void |
| Return | Return Type | Description | |
| N/A | None | Checking data from Bluetooth module | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | iSetpoint | Scope | Void |
| Return | Return Type | Description | |
| N/A | None | Increase Setpoint | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | dSetpoint | Scope | Void |
| Return | Return Type | Description | |
| N/A | None | Decrease Setpoint | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | oSetpoint | Scope | void |
| Return | Return Type | Description | |
| N/A | None | Returns the original setpoint | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | moveForward | Scope | void |
| Return | Return Type | Description | |
| N/A | None | Change the robot state to go straight | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | moveBackward | Scope | Void |
| Return | Return Type | Description | |

| | | | |
|--------------------|--------------------|--|------|
| N/A | None | Change the robot state to go backward | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | TurningLeft | Scope | void |
| Return | Return Type | Description | |
| N/A | None | Change the robot state to turn left | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | TurningRight | Scope | void |
| Return | Return Type | Description | |
| N/A | None | Change the robot state to turn right | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | SendFailToAndroid | Scope | void |
| Return | Return Type | Description | |
| N/A | None | Notify to smart phone the data error | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | SendAngleToAndroid | Scope | void |
| Return | Return Type | Description | |
| N/A | None | Send inclination angle of the robot on the phone | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | sendPWMTToAndroid | Scope | Void |
| Return | Return Type | Description | |
| N/A | None | Send PWM (Pulse Width Modulation) value from the robot to the phone. | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | sendPIDToAndroid | Scope | Void |

| Return | Return Type | Description | |
|-------------|-------------|---|------|
| N/A | None | Send current PID values of the robot to the phone | |
| Parameter | Type | Default Value | |
| N/A | None | | |
| Method Name | setPID | Scope | Void |
| Return | Return Type | Description | |
| N/A | None | Function for setting direct PID values from Bluetooth data to Robot | |
| Parameter | Type | Default Value | |
| data | String | | |

VI. System Implementation and Testing:

1. Introduction:

1.1 Purpose:

The primary purpose of this report is to detect software failures so that defects may be discovered and corrected to ensure that our project is thoroughly tested and resulting in a successful implementation project.

1.2 Test approach:

The purpose of this section is to verify and ensure that R2W's function meets its design specification and other requirements from user. The following part will describe which features to be tested.

| ID | Test Stages | Description |
|----|---------------------|--|
| 1 | Unit Testing | Unit testing will be done by the developer and approved by the development team leader. |
| 2 | Integration testing | Integration testing will be performed by testers. Requirements of the system will be tested in functional flow. Starting after unit testing complete for each flow. Focuses on specific areas of uses case when all requirement are completed, integration test should be performed to ensure all components incorporate well. |
| 3 | System testing | System Testing will be performed by the tester and development team leader with assistance from the individual developers as required. No specific test tools are available for this project. Programs will enter into System/Integration test after all critical defects have been correct. |
| 4 | Acceptance testing | Acceptance testing consist of Alpha Test and Beta Test will be executed by all team members, stand at end user point of view. Determine whether a system satisfies the requirement analysis phase. Finding defects is not the main focus in this stage. Acceptance testing will access the system's readiness for deployment and using. |

1.3 Test environment:

Test tool: A Phone with Android Operating System and having Bluetooth module to connect to R2W.

1.4 Test plans:

| No. | Component | | Feature Name | Function to be tested |
|-----|-----------------------|-------------------|--------------------|---|
| 1 | Electronic Components | Arduino Mega 2560 | Operability | Checking components that can operate following their characteristics in datasheet. |
| | | MPU6050 | | |
| | | L298 | | |
| | | HC06 | | |
| | | Motor GH-1632T | | |
| 2 | User's Interface | | Screen Display | Checking the display of element. |
| 3 | Main Function | | Connection | Testing connect between mobile phone and robot or bike via Bluetooth. |
| | | | Setting values | Testing operability of the robot or bike with PID values are transmitted from mobile phone. |
| | | | User's interaction | Testing the self-balance and movement of robot or bike by the control of the user. |

2. Test Case:

Figure 64 - Test Report of SSB

VII. System User's Manual (SUM):

1. Setting up hardware:

Supply power for robots

Figure 65 - Supply power for Robot

Start the robot

Figure 66 - Press the switch to start the Robot

2. Android application:

2.1 Connect Bluetooth:

- Choose connect Bluetooth on setting of smart phone
- Click on “Yes” to search the device that need to connect
- After connect successful, screen display “Connected” status

Figure 67 - Choose connect Bluetooth on the setting of smart phone

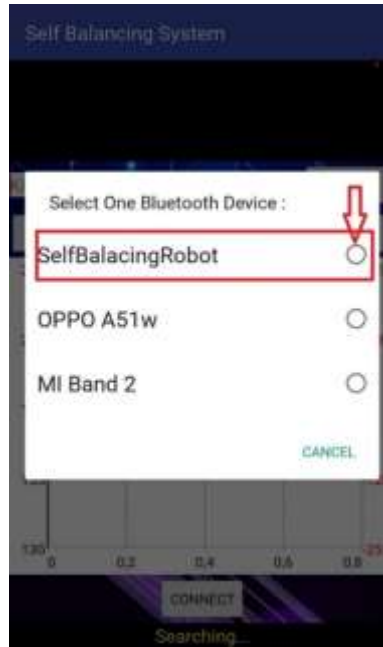

Figure 68 - Choose device that want to connect

Figure 69 - Connected successful to Robot

2.2 Control movement:

Move forward:

- Click “FORWARD” button on the main screen.
- Robot will go straight and display “moveForward” status on the main screen.
- Click “Stop” button to stop the robot.

Figure 70 - Click on Forward button

Figure 71 - Show status

Figure 72- Click Stop button

Move backward:

- Click “BACKWARD” button on the main screen.
- Robot will go straight and display “moveBackward” status on the main screen.
- Click “Stop” button to stop the robot.

Figure 73 - Click "Backward" button

Figure 74 - Display status

Figure 75 – Click "Stop" button

Turn left:

- Click “TURNLEFT” button on the main screen.
- Robot will go straight and display “Turning Left” status on the main screen.
- Click “Stop” button to stop the robot.

Figure 76 - Click Turn Left button

Figure 77 - Show status

Figure 78- Click Stop button

Turn right:

- Click “TURNRIGHT” button on the main screen.
- Robot will go straight and display “Turning Right” status on the main screen.
- Click “Stop” button to stop the robot.

Figure 79 - Click Turn Right button

Figure 80 - Show status

Figure 81 - Click Stop button

2.4 Setting PID values:

- Input new PID values.
- Display status on the main screen.

Figure 82 - Input new PID values

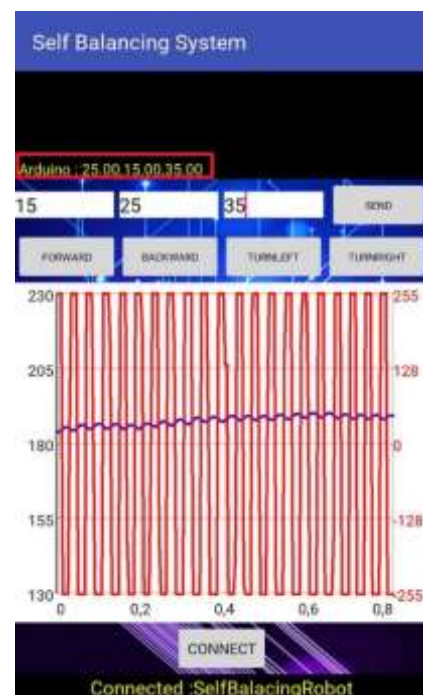

Figure 83 - Show status
